hello-genai

A simple chatbot web application built in Go, Python and Node.js that connects to a local LLM service (llama.cpp) to provide AI-powered responses.

Environment Variables

The application uses the following environment variables defined in the `.env` file:

- `LLM_BASE_URL` : The base URL of the LLM API
- `LLM_MODEL_NAME` : The model name to use

To change these settings, simply edit the `.env` file in the root directory of the project.

Quick Start

1. Clone the repository:

```
git clone https://github.com/docker/hello-genai
cd hello-genai
```

2. Run the application using the script:

```
./run.sh
```

3. Open your browser and visit the following links:

<http://localhost:8080> for the GenAI Application in Go

<http://localhost:8081> for the GenAI Application in Python

<http://localhost:8082> for the GenAI Application in Node

<http://localhost:8083> for the GenAI Application in Rust

Requirements

- macOS (recent version)
- Either:
 - Docker and Docker Compose (preferred)
 - Go 1.21 or later
- Local LLM server

If you're using a different LLM server configuration, you may need to modify the `.env` file.
